The figures listed above represent the rounded percentage of the population who do not have access to "at least basic" levels of sanitation service (as of 2015). For countries that do not have a figure listed below them, percentages were not available. These statistics were taken from WHO/UNICEF Joint Monitoring Programme (JMP), *Estimates on the use of water, sanitation and hygiene by country (2000-2015)*, [www.washdata.org/data](http://www.washdata.org/data)

According to the JMP ladder for sanitation services, this includes open defecation, whereby human faeces are disposed in fields, forests, bushes, open bodies of water, beaches or other open spaces, or with solid waste; unimproved services, which includes pit latrines without a slab or platform, hanging latrines or bucket latrines; and limited services, which is where improved sanitation facilities are shared between two or more households. Sanitation services are deemed "at least basic" if improved sanitation facilities are not shared with other households, and/or where excreta are safely disposed of in situ or transported and treated offsite.
